Anatomy And Physiology Digestive System Quizzes
Digestive System

Mouth
Salivary enzymes begin carbohydrate digestion and break up food particles.

Pharynx
Directs food into the stomach to prevent choking.

Salivary glands
Meets and lubricates food. The enzyme amylase digests carbohydrates.

Liver
The largest organ inside the body. Makes bile (fluid that helps break down fats and gets rid of wastes in the body); changes food into energy; and clears alcohol, some medicines, and poisons from the blood. Stores vitamins and iron. Destructs old blood cells.

Oesophagus
Carries food down from the mouth to the stomach.

Stomach
Stores and churns food. Enzyme pepsin digests protein.

Gallbladder
Stores the bile made in the liver, then empties it into the small intestine to help digest fats. Stones can form within.

Small intestine

Appendix
A pouch attached to the first part of the large intestine. No one knows its function.

Pancreas
A gland that makes enzymes for digestion, and bicarbonate to neutralize stomach acid. Also makes the hormone insulin, which helps the body turn food into energy and regulates blood sugar levels.

LARGE intestine
Also called the colon. It absorbs water and electrolytes from stool. It also contains beneficial bacteria which produce certain vitamins. Farms and stores feces.

Rectum
The lower end of the large intestine, leading to the anus. Stores and expels feces.

The Big Slide-Nicholas F. Prayson 2015 The human digestive system plays an important role in processing food in order to provide nutrients that the body can use. This well-illustrated text presents the basics of anatomy, physiology and disease of the human digestive system by answering a series of questions relevant to the various components of this system. For example, in studying the stomach, the following questions are examined: 1) Where is the stomach located? 2) What does the stomach look like? 3) What does the stomach
do? 4) Where do gastric juices come from? 5) What causes ulcers? 6) What causes a stomach ache? and 7) What causes burping? Additionally, most chapters are filled with unusual trivia related to the part of the body being discussed. For example, there was a 42-year-old woman who complained of mild abdominal pain and had 2533 objects removed from her stomach, including 947 pins. The text provides a fun and interesting way to learn more about the digestive system. The text is ideal, whether you are looking for an entertaining and informative read on the workings of the human digestive tract or looking for a text or resource for biology or health classes.

Introduction to Anatomy & Physiology 2 + Digestive System & Metabolism, Vol. 4 + The Nervous System-Tommy Mitchell, Dr. 2018-09-25 The introduction to anatomy and physiology continues as students are given a deeper understanding of God’s wonderful design of their bodies. How do just the correct muscles know how to contract in just the right way to allow us to walk? How can we control the movements of our hands in a very precise fashion so that we can brush our teeth? How can we decipher those funny marks on a printed page, understand that they are letters and punctuation marks, and make sense of them? How can we hear others
singing and make our voices match theirs? How does the cereal you had for breakfast become energy? Or the popcorn you had at the ballgame? How does the chicken you had for supper provide the amino acids the body needs to build proteins? These questions and more are answered as we look into the wonders of God's awesome creation, which can only be truly understood as a product of the Master Designer.

FEATURES: The calendar provides 5 lessons weekly with clear objectives, and the worksheets, quizzes, and tests are all based on the readings from the two books.

Anatomy and Physiology-Edwin B. Steen 1964
Anatomy & Physiology-Blair Fraser & Bev Lott 2019-04-18

Anatomy is the study of the structure and relationship between body parts. Physiology is the study of the function of body parts and the body as a whole. Human anatomy describes the structure of organs, muscles, bones and their function. It has two major parts: Microscopic anatomy and Macroscopic anatomy. The human's investigation body includes life anatomy and physiology. Living systems can be defined from various perspectives, from the broad (looking at the entire earth) to the minute (individual atoms). The chemical level, atoms, molecules (combinations of atoms), and the chemical bonds between atoms provide the framework upon which all living activity is based. The cell is the smallest unit of life. Organelles within the cell are specialized bodies performing specific cellular functions. Cells themselves may be specialized. Thus, there are nerve cells, bone cells, and muscle cells. An organ system is two or more organs working together to accomplish a particular task. The digestive system, for example, involves the coordinated activities of many organs, including the mouth, stomach, small and large intestines, pancreas, and liver. The present book Anatomy and Physiology discusses all the important aspects of anatomy and physiology and its related fields.

Anatomy and Physiology of Domestic Animals-R. Michael Akers 2013-03-25

Research on the Digestive System of the Schizopoda-Charles Gelderd 2017-07-09 Excerpt from Research On The Digestive System Of The Schizopoda: Anatomy, Histology And Physiology

The present work on the digestive system of the Schizopoda is part of a group of investigations, on the morphology of the Arthropoda, undertaken by Professor Gilson with the help of his students. The chief purpose of this research is to make known, with as much detail and precision as possible, the internal organisation of these animals, in order to discover whether the like and the different characters that are found between one group and another, and between one species and another, tend to bring together or to separate them, in the same way as the study of their purely external characters. In other words, does the study of their internal organisation lead us to classify them in the same way, as the study of their purely external morphology? It is on the latter that even the most recent systems of classification are almost exclusively based, although their authors are anxious to express the natural relationships of the groups and the species. Human Body Anatomy-Knowledge Flow 2014-08-19 The term “Anatomy” comes from the ancient Greek it means “to dissect”. The human anatomy is divided into two subdivision macroscopic and microscopic anatomy. Human anatomy can be specifically defined as a corresponding basic medical science, which deals with the scientific study of morphology of human body. In easy words, human anatomy is the study of human body structure. Human anatomy provides a detail but valuable explanation of end to end concepts of human anatomy. It is composed of several types of cells which are together forms tissues and then organ systems. The study of the human body includes anatomy, physiology and histology. Physiology emphasizes on the organs and systems of the human body and their functions. In this book all the topics are fully explained in such manner which are easily read and learn.
