The cardiovascular system consists of the heart and blood vessels. The heart is a muscular organ that pumps blood throughout the body. Blood vessels are blood vessels that carry blood to and from the heart. The cardiovascular system is responsible for the transport of oxygen, nutrients, and waste products to and from the body's tissues. The cardiovascular system also plays a role in maintaining the body's temperature and pH balance.

The heart is the organ responsible for pumping blood throughout the body. It is a muscular organ that contains four chambers: the right atrium, the right ventricle, the left atrium, and the left ventricle. The right atrium receives blood from the body, while the right ventricle pumps blood to the lungs for oxygenation. The left atrium receives oxygenated blood from the lungs, while the left ventricle pumps oxygenated blood to the body.

Blood vessels are blood vessels that carry blood to and from the heart. They are responsible for the transport of oxygen, nutrients, and waste products to and from the body's tissues. The blood vessels include arteries, which carry oxygenated blood away from the heart, veins, which carry deoxygenated blood back to the heart, and capillaries, which are small blood vessels that exchange oxygen, nutrients, and waste products between the blood and the body's tissues.

The cardiovascular system is divided into two main systems: the systemic circulation and the pulmonary circulation. The systemic circulation carries oxygenated blood from the left ventricle to the body's tissues and returns deoxygenated blood to the right atrium. The pulmonary circulation carries deoxygenated blood from the right ventricle to the lungs for oxygenation and returns oxygenated blood to the left ventricle.
