Anatomy of Digestive System of Pigeon with Regard to Age-Sajid Raza 2012-08 The digestive system of the birds have some unique aspects in that it stores food temporarily in the crop, and masticates it in the gizzard rather than in the mouth like the other animals. The vertebrate gastrointestinal tract is a dynamic organ (Brugger, 1991). The digestive organs of birds consist of the epithelium derived from the endoderm (Romanoff, 1960). Birds have a digestive tract (GI tract) that is much shorter (to reduce weight for flight) and have a specially modified stomach for processing seeds and plant material. In pigeons, the crop lining changes dramatically when they are feeding young. Birds depend heavily on their digestive system to remain nourished and healthy.

Illustrated Abdominal Surgery-Hisashi Shinohara 2020-05-08 This comprehensive, illustrated guide presents representative general surgery, including gastrointestinal tract, hepatobiliary and inguinal hernia. Surgery is generally based on the microanatomy; however, in practice surgery involves more dynamic and floating anatomy. In the last decade, the methods have been constantly improved, shedding new light on classical anatomical science. Laparoscopic is one such methodology. All illustrations presented in this book have been drawn by the author - a pioneering surgeon - and show real-world procedures. All the methods introduced are practical and have been refined based on the precise clinical and embryological anatomy. This unique book offers readers essential insights into efficient and high-integrity surgeries in abdominal region. As such, it is a valuable resource for all gastrointestinal surgeons.

The Digestive System in Mammals-D. J. Chivers 2005-10-06 However well the anatomy of the gastrointestinal tracts of a wide range of mammals are described and quantified, there can be no real explanation of observed patterns without consideration of the mechanical and chemical properties of the food consumed, and digestive stages involved in its processing. This book aims to integrate findings from the many different types of investigations of mammalian digestive systems into a coherent whole. Using the themes of food, form and function, researchers discuss models of digestive processes, linking this with evolutionary aspects of food
Anatomy Of Digestive System In Cattle

This book provides an integrated textbook on the digestive system, covering the anatomy, physiology and biochemistry of the system, all presented in a clinically relevant context appropriate for the first two years of the medical student course. One of the seven volumes in the Systems of the Body series. Concise text covers the core anatomy, physiology and biochemistry in an integrated manner as required by system- and problem-based medical courses. The basic science is presented in the clinical context in a way appropriate for the early part of the medical course.

The Big Slide-Nicholas F. Prayson 2015

The human digestive system plays an important role in processing food in order to provide nutrients that the body can use. This well-illustrated text presents the basics of anatomy, physiology and disease of the human digestive system by answering a series of questions relevant to the various components of this system. For example, in studying the stomach, the following questions are examined: 1) Where is the stomach located? 2) What does the stomach look like? 3) What does the stomach do? 4) Where do gastric juices come from? 5) What causes ulcers? 6) What causes a stomach ache? and 7) What causes burping? Additionally, most chapters are filled with unusual trivia related to the part of the body being discussed. For example, there was a 42-year-old woman who complained of mild abdominal pain and had 2533 objects removed from her stomach, including 947 pins. The text provides a fun and interesting way to learn more about the digestive system. The text is ideal, whether you are looking for an entertaining and informative read on the workings of the human digestive tract or looking for a text or resource for biology or health classes.

Comparative Anatomy of the Gastrointestinal Tract in Eutheria II-Andreas Schmidt-Rhaesa 2017-10-23

This volume of the series Handbook of Zoology deals with the anatomy of the gastrointestinal digestive tract – stomach, small intestine, caecum and colon – in all eutherian orders and suborders. It presents compilations of anatomical studies, as well as an extensive list of references, which makes widely dispersed literature accessible. Introductory sections to orders and suborders give notice to biology, taxonomy, biogeography and food of the respective taxon. It is a characteristic of this book that different sections of the post-oesophageal tract are discussed separately from each other. Informations on form and function of organs of digestion in eutherians are discussed under comparative-anatomical aspects. The variability and diversity of anatomical structures represents the basis of functional differentiations.

The Digestive System- 1957

The new edition of Principles of Anatomy and Physiology maintains the superb balance between structure and function. It continues to emphasize the correlations between normal physiology and pathophysiology, normal anatomy and pathology, and homeostasis and homeostatic imbalances. The acclaimed illustration program is also even better along with the redevelopment of many of the figures depicting the toughest topics to grasp.

Research On The Digestive System Of The Schizopoda-Charles Gelderd 2017-12-18 Excerpt from Research On The Digestive System Of The Schizopoda: Anatomy, Histology And Physiology The present work on the digestive system of the Schizopoda is part of a group of investigations, on the morphology of the Arthropoda, undertaken by Professor Gilson with the help of his students. The chief purpose of this research is to make known, with as much detail and precision as possible, the internal organisation of these animals, in order to discover whether the like and the different characters that are found between one group and another, and between one species and another, tend to bring together or to separate them, in the same way as the study of their purely external characters. In other words, does the study of their internal organisation lead us to classify them in the same way, as the study of their purely external morphology? It is on the latter that even the most recent systems of classification are almost exclusively based, although their authors are anxious to express the natural relationships of the groups and the species.
