Male Reproductive System-Akmal El-Mazny 2016-01-01 The male...
Anatomy of Male Reproductive System consists of the hypothalamic-pituitary unit, the testes, the reproductive tract, and the external genitalia. The functions of the male reproductive system are to produce and deliver spermatozoa, for sexual reproduction, and produce hormones that regulate reproductive function and secondary sex characteristics. Abnormalities in anatomic or physiologic function affect the development and delivery of spermatozoa, and potential fertility. Male factors are often the cause of a couple's failure to conceive, therefore, it is important to evaluate and treat the male partner. A male factor may be due to abnormalities of hormonal control, testicular function, or sperm transport or delivery. This book provides a comprehensive review of the clinical anatomy and physiology specific to male reproductive system, emphasizing causes and management of male infertility. By developing a clear understanding of what is normal, you will better understand abnormalities affecting male fertility and the mechanisms behind treatment.

Male animals are fundamental in successful breeding plans so it is imperative to be well versed with functional anatomy of male reproductive organs. Since no comprehensive baseline data are available about the gross morphometry of the male reproductive organs in the local goat population in Pakistan. The current monograph is the description of the research conducted on caprine testis, epididymis, vas deference and seminal vesicle of the adult male goats reared by the farmers in different region of the country. This monograph provides valuable information to the researchers in the field of Animal Reproduction, Animal Reproductive Biotechnology as well as in Reproductive Biology or Anatomy.

The Anatomy and Histology of the Male Reproductive System of the Legionary Ant, Neivamyrmex Harrisi (haldeman) (formicidae, Hymenoptera)-Dominic Do-Van-Qui 1960

The Male Reproductive Organs- 2015 Dr Alice Roberts looks at those bits men don't like to mention to their doctors - The Male Reproductive Organs. Yet with 10,000 men a year in the UK alone dying from prostate cancer (a condition which is nearly always curable if caught early enough), men do need to learn more about their bodies. So with her
trademark no-nonsense style, Alice gets to work explaining how the male anatomy works and offering practical advice on how to keep it all healthy. She's joined by Mark Smallman, a 30-year-old events manager living in Birmingham. Like most men, Mark realises he actually knows very little about his own body: "It's probably a quite basic understanding to be honest - schoolboy stuff". Mark's education begins in the lab, with Dr Alice dissecting a pig's male reproductive organs and getting Mark to cut through a testicle. Although testicular cancer is fairly uncommon, Mark is in the age group most at risk - that's men under 40. So asking questions on behalf of all men, Mark also discovers how to self-examine for lumps by meeting urologist Alan Doherty and having his own testes pictured on an ultrasound. Mr Doherty also carries out a pioneering operation (filmed in the programme and watched by Mark) on a prostate cancer sufferer. Ian Roberts, a police officer in his early fifties from Coventry, has the cancer removed using keyhole surgery. He explains what his symptoms were and why it is important for men to have regular checks at their doctors. Other features of this episode of The Male Reproductive Organs include some cross-country runners used to demonstrate the journey of the sperm from the testes to the female reproductive system; modelling clay and wire wool to show how the male anatomy sits in the pelvis; a fuzzy-felts game made by Dr Alice to test pub-goers' knowledge of the male anatomy and balloons to demonstrate how an erection works. Part of a series, Don't Die Young - Series 2 Part of a series of BBC TV programmes about health and medicine issues.

The Reproductive System-The Open The Open Courses Library 2019-10-25 The Reproductive System Biology Small, uncoordinated, and slick with amniotic fluid, a newborn encounters the world outside of her mother's womb. We do not often consider that a child's birth is proof of
the healthy functioning of both her mother's and father's reproductive systems. Moreover, her parents' endocrine systems had to secrete the appropriate regulating hormones to induce the production and release of unique male and female gametes, reproductive cells containing the parents' genetic material (one set of 23 chromosomes). Her parent's reproductive behavior had to facilitate the transfer of male gametes--the sperm--to the female reproductive tract at just the right time to encounter the female gamete, an oocyte (egg). Finally, combination of the gametes (fertilization) had to occur, followed by implantation and development. In this book, you will explore the male and female reproductive systems, whose healthy functioning can culminate in the powerful sound of a newborn's first cry. Chapter Outline: Anatomy and Physiology of the Male Reproductive System Anatomy and Physiology of the Female Reproductive System Development of the Male and Female Reproductive Systems The Open Courses Library introduces you to the best Open Source Courses.

Male Reproductive Dysfunction-Fouad R. Kandeel 2007-05-22 The successful practice of reproductive medicine requires the coordinated efforts of many medical professionals. The book discusses normal anatomy and physiology of the male reproductive system. It examines psychological and social influences, and the pathophysiology that can affect the male reproductive system from infancy through adulthood. It provides clear guidelines and algorithms for the assessment of male hypogonadism and infertility, from relevant history and physical exam findings to the proper interpretation of laboratory results. The book examines imaging technology and the currently available treatment strategies for male hypogonadism and infertility. Additional topics include immunological factors, the preservation of fertility in males with cancer, and the treatment of men with spinal cord injury and other neurologically disabling diseases.
