Using Taylor formula written before (adding more Taylor terms the change is negligible) you simply got the correct relativistic kinetic energy of our moving ball: about $\$5000.000000000417\$ J$ ($\frac{3mv^4}{8c^2} \approx 4.17 \cdot 10^{-10} \$ J$). So in this case classical and relativistic results differ of about $\$0.0000000001\%$. All this show ...

Elementary classical mechanics is essential, of course, and a little electrodynamics would be useful in places. As always, the more physics and math you know the easier it will be, and the more you will get out of your study. But I would like to emphasize that quantum mechanics is not, in my view, something that flows smoothly and naturally from earlier theories. On the contrary, it represents ...
