Measurement Uncertainty in Chemical Analysis-Paul De Bièvre 2003-01-17 It is now becoming recognized in the measurement community that it is as important to communicate the uncertainty related to a specific measurement as it is to report the measurement itself. Without knowing the uncertainty, it is impossible for the users of the result to know what confidence can be placed in it; it is also impossible to assess the comparability of different measurements of the same parameter. This volume collects 20 outstanding papers on the topic, mostly published from 1999-2002 in the journal "Accreditation and Quality Assurance." They provide the rationale for why it is important to evaluate and report the uncertainty of a result in a consistent manner. They also describe the concept of uncertainty, the methodology for evaluating uncertainty, and the advantages of using suitable reference materials. Finally, the benefits to both the analytical laboratory and the user of the results are considered.

Combined Compendium of Food Additive Specifications: Analytical methods, test procedures and laboratory solutions used by and referenced in food additive specifications-Joint FAO/WHO Expert Committee on Food Additives 2005 This publication is one of four volumes comprising the combined food additive

specifications prepared by the Joint FAO/WHO Expert Committee on Food Additives (JECFA) during 65 meetings held during the years 1956 to 2005. The objectives of these specifications are to identify additives subjected to safety testing, to ensure quality standards required for use in food or in processing, and to reflect and encourage good manufacturing practice. This volume covers methodology and analytical procedures used. The other volumes are: Vol. 1: additives A-D (ISBN 9789251053928); Vol. 2: additives E-O (ISBN 9789251053935). Vol. 3: additives P-Z (ISBN 9789251053942).

Sources of Systematic Bias Reflected in an ASTM Collaborative Study on Water in Oil Measured by the Karl Fischer Method-SA. Margolis 2000 A collaborative study on the precision and bias of the measurement of water in transformer oils indicated that an acceptable level of precision was achieved using the revised ASTM Test Method for Water in Insulating Liquids by Coulometric Karl Fischer Titration (D 1533-96) and a sample size of 7 mL. Analysis of the distribution of the laboratory results indicates the existence of a systematic bias in the accuracy of the

measurement which is related to the instrument design, solvent composition, and calibration of the instrument. Additionally, evidence is presented that indicates that a portion of the water in the oils is not titrated by the coulometric method.
