 South Georgia is rich in wildlife and spectacular scenery, and it is a prime destination spot on most Antarctic tours. This beautifully illustrated field guide depicts the birds, mammals, insects, flowering plants, and other vegetation found in this unique part of the world. It features 368 full-color photographs of more than 180 species, including 65 species of birds, 20 species of sea mammals, nearly 60 species of insects, and more than 40 species of flowering and nonflowering plants. Detailed species accounts describe key identification features, with information on status, behavior, threats, and distribution. This one-of-a-kind photographic guide also includes introductory chapters on South Georgia's geography, climate, ecology, and conservation. Features 368 photos of more than 180 species Covers birds, sea mammals, insects, and plants Provides detailed species accounts Includes chapters on geography, climate, ecology, and conservation The only photographic field guide to focus specifically on South Georgia

 This multi-disciplinary book will cater to students and those who want to have a more critical look behind the scenes of Antarctic science. This book will take a systems approach to providing insights into Antarctic ecosystems and the geophysical environment. Further, the book will link

these insights to a discussion of current issues, such as climate change, bio prospecting, environmental management and Antarctic politics. It will be written and edited by experienced Antarctic researchers and scientists from a wide range of disciplines. Academic references will be included for those who wish to delve deeper into the topics discussed in the book.

 Seeds provide half of the calories consumed by humans today and helped grow human civilization. Just ten crops (rice, maize, wheat, potatoes, etc.) provide 75% of human energy needs. Seeds: A Natural History unearths the evolution of seeds from the time before dinosaurs to how they became our primary source of calories and protein today. Using vivid photos of seeds, which invite readers to appreciate their diversity of form and function, along with a text by an award winning science journalist and writer, Seeds harvests the importance of the nature and productivity of seeds. And to complete the narrative arc, Seeds shows how modern scientific techniques of genetic profiling, seed banking, and plant breeding may be the answer to humanity's future. Seeds and humans have had a bountiful history and this book captures the scientific, artistic, and economic vitality of these incredible natural packages.

 This book tells the story of Marion Island and Prince Edward Island, South Africa's southernmost territories; their fiery origins, their discovery and exploitation, the amazing plants and animals that live and grow there, and their current importance for research and conservation. The book features various photographs which capture the beauty of these remote and unique environments.

 Over the last 40 years, applied climatologists have been producing increasingly sophisticated and insightful research which has led to the current level of recognition that climate and particularly climatic changes have important environmental, economic, and recreational impacts. Furthermore, as societal needs for optimizing the use of resources increase, applied climatology will continue to grow in importance. Selected Readings in Applied Climatology is a collection of academic-style vignettes of research over the past 40 years that represents the evolution of this important subfield, and, therefore, provides a framework for appreciating the impacts of climate on society. After an introductory editorial chapter placing the development of applied climatology in its historical context, the book is divided into topical sections on applied climatological research in atmospheric circulation variability; the biosphere; water and energy resources;

agriculture; and human health, comfort and behavior. The final section includes a collection of essays on communicating climatic information to the public. Selected Readings in Applied Climatology will be beneficial to those whose field of interest affects, and is affected by, climate, such as meteorologists, ecologists, water resource planners, energy demand forecasters, commodities brokers, agriculturalists, sociologists, and media consultants.

Considering Animals draws on the expertise of scholars trained in the biological sciences, humanities, and social sciences to investigate the complex and contradictory relationships humans have with nonhuman animals. Taking their cue from the specific 'animal moments' that punctuate these interactions, the essays engage with contemporary issues and debates central to human-animal studies: the representation of animals, the practical and ethical issues inseparable from human interactions with other species, and, perhaps most challengingly, the compelling evidence that animals are themselves considering beings. Case studies focus on issues such as animal emotion and human 'sentimentality'; the representation of animals in contemporary art and in recent films such as March of the Penguins, Happy Feet, and Grizzly Man; animals' experiences in catastrophic events such as Hurricane

Katrina and the SARS outbreak; and the danger of overvaluing the role humans play in the earth's ecosystems. From Marc Bekoff's moving preface through to the last essay, Considering Animals foregrounds the frequent, sometimes uncanny, exchanges with other species that disturb our self-contained existences and bring into focus our troubled relationships with them. Written in an accessible and jargon-free style, this collection demonstrates that, in the face of species extinction and environmental destruction, the roles and fates of animals are too important to be left to any one academic discipline.

Famous for their size and elegance in flight, albatrosses are familiar to anyone who has travelled through the southern oceans, and are a flagship family of conservation concern. However, albatrosses are just one of several groups of 'pelagic' birds - those that visit land only to breed, and spend the rest of their lives far from the coast, soaring from ocean to ocean in a never-ending search for food. Mysterious and graceful, these birds can present a formidable identification challenge to even the most experienced birder. This book provides the answer - the first comprehensive guide to pelagic birds, the albatrosses, petrels, shearwaters, storm-petrels and diving petrels. A total of 46 spectacular colour plates highlight key ID criteria of the birds in flight, with close-ups of diagnostic regions of the

plumage. The plates are accompanied by accurate distribution maps, while the sparkling text brings the world of these amazing birds to life. Several extremely rare species, such as Beck's Petrel, are illustrated for the first time, while the New Zealand Storm-petrel, rediscovered as recently as 2004, is also included. Seawatchers all around the world will find this superb field guide indispensable.

The reader will find out what it means to be slotted, the shortcomings of homers, the joys of a donga and the hazards of a growler. Celebrating the amazing and often unique species of this spectacular environment, the title features chapters on the region's famous whales and penguins, and also on lesser known species such as skuas and sheathbills, with full coverage of plumage and identification. Each chapter is accompanied by vibrant illustrations from Dafila Scott to help bring species to life. Tony Soper's immaculate and engaging text remains the indispensable choice for the intrepid wildlife enthusiast. Antarctica's wildlife is under threat. The Southern Ocean is warming and the most obvious effect is on the continental ice shelves. Spectacular retreats and monster carvings from the west coast of the peninsula have been seen in recent decades. Less ice means fewer krill, which depend on the ice-edge for the algae which nourish them. In turn, this will impact on seal and whale numbers. In the case of penguins, while kings and macaronis, for instance, are doing well, the magnificently adapted and truly Antarctic species, Adélie and emperors, are in decline. In the case of emperors, maybe by as much as 50%. Bradt's <i>Antarctica</i> not only helps you to identify and understand species and habitats, it also explains the issues faced by this extraordinary continent, regarded by many as one of the most precious places on the planet.</p>

provided by nature. Examples include water and air quality regulation, nutrient cycling and decomposition, plant pollination and flood control, all of which are dependent on biodiversity. They are predominantly public goods with limited or no markets and do not command any price in the conventional economic system, so their loss is often not detected and continues unaddressed and unabated. This in turn not only impacts human well-being, but also seriously undermines the sustainability of the economic system. It is against this background that TEEB: The Economics of Ecosystems and Biodiversity project was set up in 2007 and led by the United Nations Environment Programme to provide a comprehensive global assessment of economic aspects of these issues. This book, written by a team of international experts, represents the scientific state of the art, providing a comprehensive assessment of the fundamental ecological and economic principles of measuring and valuing ecosystem services and biodiversity, and showing how these can be mainstreamed

into public policies. This volume and subsequent TEEB outputs will provide the authoritative knowledge and guidance to drive forward the biodiversity conservation agenda for the next decade.
