An Introduction To the Logic of Psychological Measurement-Joel Michell 2014-02-04 This book declines to take for granted the widespread assumption that existing psychometric procedures provide scientific measurement. The currently fashionable concepts of measurement within psychology -- operationalism and representationalism -- are critically examined, and the classical view, that measurement is the assessment of quantity, is defended. Within this framework, it is shown how conjoint measurement can be used to test the hypothesis that variables are quantitative. This theme is developed in detail using familiar psychological examples, such as Thurstone's law of comparative judgment, multidimensional scaling, and Coombs' theory of unfolding.

Introduction to Scientific Psychology-Henry D. Jr. Schlinger 2013-11-21 We humans are faced with an interesting problem: That which we think we understand the most—our own behavior—we probably
understand the least. On the eve of a new millennium, the planet is beset by a host of problems that are, for the most part, caused by human behavior. Ironically, although it seems that the greatest impact of our behavior is on the planet and its other inhabitants, we may actually be threatening our own future the most. For example, we have caused untold harm to the air we breathe, to the water we drink, and, by extension, to much of the food we eat. More important perhaps, we have created a society in which, among other things, many people are anxious and depressed. Young women starve themselves, and alcohol and cigarette use are responsible for hundreds of thousands of cases of illness and death every year. And humans still murder one another at an astounding rate, while at the same time continuing to affirm the value of human life. At a time when it is critical that our children become educated, more and more children are not learning the basic skills they will need to think logically so that they can begin to solve the world's problems. The question may be not "Can the planet survive?" but, rather, "Can we humans survive and change our own destructive actions?"

Psychology for Dancers-Brian Thomas 2017-05-16 The advice offered in this book draws on numerous theories and research findings in psychology and behavioural science. However it is essentially a personal approach based on experience of working with dancers, student dancers and dance teachers in various contexts and locations over a number of years. Its main purpose is to offer a broad perspective on the psychological pressures that dancers and student dancers commonly face and provide some practical suggestions on how these pressures may best be managed. Although the vast majority of my experience has been in the context of classical ballet I hope that the advice given here will be relevant to dancers, teachers and student dancers in all professional disciplines.

Learning to Learn-Ingrid Pramling 2012-12-06 For eight years, since I began my research, my main concern has been to understand children and their world. The first step towards understanding how children think was taken in connection with my thesis, which I presented five years ago. This was a description of how children in the age group three to eight years conceive their own learning. The thesis was published in the same series as the present monograph and is entitled "The child's conception of learning". The main emphasis in this study was on developmental psychology. As I have worked as a preschool teacher myself, I am extremely anxious that my research will be of benefit to my former colleagues. I have therefore devoted a great deal of time to writing and collaborating in numerous books of popular science. These have always been based on my own research. Now, however, the time is ripe for taking a new step, based on new research, towards understanding children and helping others to understand them., this time by publishing "Learning to learn", which is a description of how children have actually been taught to learn in preschool. In this type of study it is not a question of first obtaining results of the nature of basic research and then applying them in the educational setting, but both aspects are integrated in that the starting-point is the phenomena that are of importance to children in their everyday life.
