Rain Gardens For the Pacific Northwest—Zsofia Pasztor 2017-01-15 Rain pounds the Pacific Northwest, gushing through dirty downspouts, across chemically treated lawns, over oily streets and through public storm drains into bays, rivers, lakes, streams, and wetlands where nature struggles to survive among the pollutants. It’s a problem caused by population density and it’s one that you can help solve. Rain Gardens for the Pacific Northwest shows you how to trap and filter dirty water safely in your yard—and how to do that with a beautiful addition to your home. Zsofia Pasztor, a Certified Professional Horticulturalist, shares what she’s learned over the years experimenting with rain gardens in the challenging clay and hardpan soils of the region. The book answers questions that Zsofia regularly encounters in her workshops, including: • Can I build a rain garden myself? • Can a rain garden be too big or too small? • Can I create a low-maintenance rain garden? • Will my rain garden attract mosquitos? • How do you know if your infiltration system is in a “safe” location? • If my rain garden isn’t working (e.g., not draining), how can I fix it without starting over? With photos and illustrations throughout, lists of best plants, and a comprehensive resources section, this easy-to-use guide shows Northwest gardeners, homeowners, and DIY-ers how to plan, design, install, and maintain their own healthy, natural, and beautiful rain garden.

The Rough Guide to the Pacific Northwest—J. D. Dickey 2004 The Rough Guide to the Pacific Nortwest is the definitive guide to one of the world''s most breathtaking corners. A full-colour introduction includes the author’s hand-picked round-up of “Things not to Miss”, including sights, activities, events and natural wonders. There is detailed coverage of the area’s near-limitless outdoor pursuits, from kayaking in the Puget Sound to hiking the Pacific Coast Trail. There are vivid accounts of Vancouver, Seattle and Portland, along with the region's stunning national parks, rugged volcanic peaks and pristine seascapes. For every area, insightful reviews of the best places to stay, eat and drink help the reader get a true tase of the area, whatever their budget.

Northwest Forest Plan, the First 10 Years (1994-2003): Timber and nontimber resources—2006 The socioeconomic monitoring report addresses two evaluation questions posed in the Northwest Forest Plan (the Plan) Record of Decision and assesses progress in meeting five Plan socioeconomic goals. Volume I of the report contains key findings. Volume II addresses the question, Are predictable levels of timber and nontimber resources available and being produced? It also evaluates progress in meeting the goal of producing a predictable level of timber sales, special forest products, livestock grazing, minerals, and recreation opportunities. The focus of volume III is the evaluation question, Are local communities and economies experiencing positive or negative changes that may be associated with federal forest management? Two Plan goals are also assessed in volume III: (1) to maintain the stability of local and regional economies on a predictable, long-term basis and, (2) to assist with long-term economic development and diversification to minimize adverse impacts associated with the loss of timber jobs. Progress in meeting another Plan goal— to promote agency-citizen collaboration in forest management— is evaluated in volume IV. Volume V reports on trends in public values regarding forest management in the Pacific Northwest over the past decade, community views of how well the forest values and environmental qualities associated with late-successional, old-growth, and aquatic ecosystems have been protected under the Plan (a fifth Plan goal), and issues and concerns relating to forest management under the Plan expressed by community members. Volume VI provides a history of the Northwest Forest Plan socioeconomic monitoring
program and a discussion of potential directions for the program.
The Pacific Northwest—Raymond D. Gastil 2010-04-23 The Pacific Northwest—for the purposes of this book mostly Oregon and Washington—has sometimes been seen as lacking significant cultural history. Home to idyllic environmental wonders, the region has been plagued by the notion that the best and brightest often left in search of greater things, that the mainstream world was thousands of miles away—or at least as far south as California. This book describes the Pacific Northwest’s search for a regional identity from the first Indian-European contacts through the late twentieth century, identifying those individuals and groups “who at least struggled to give meaning to the Northwest experience.” It places particular emphasis on writers and other celebrated individuals in the arts, detailing how their lives and works both reflected the region and also enhanced its sense of self.

Third Forest Vegetation Simulator Conference- 2008 The Forest Vegetation Simulator (FVS) is a suite of computer modeling tools for predicting the long-term effects of alternative forest management actions. FVS was developed in the early 1980s and is used throughout the United States and British Columbia. The Third FVS conference, held February 13-15, 2007, in Fort Collins Colorado, contains 20 papers. They describe the use of FVS on the stand and landscape scale, and to analyze fuels management in the presence of insects and fire. Several papers compare FVS predictions of the effects of insects and disease to field measurements. FVS is continually evolving and improving in technology and capability to meet the needs of its ever increasing user community. Papers describe new methods for data acquisition and preparation for input to FVS, new economic analysis capabilities within FVS, new methods for simulating forest regeneration, new developments in calculating growth and mortality, and future plans for incorporating the effects of climate change in model simulations.

Nursery Manual for Native Plants-R. Kasten Dumroese 2009 In 2001, the Forest Service, U.S. Department of Agriculture (USDA), through its Virtual Center for Reforestation, Nurseries, and Genetics Resources (RNGR), invited Native Americans from across the United States to attend the Western Forest and Conservation Nursery Association annual meeting. About 25 tribal members, representing 20 tribes, attended the meeting at Fort Lewis College in Durango, Colorado. The following year, a similar meeting was held in Olympia, Washington, and tribal members initiated a Tribal Nursery Council and requested that RNGR facilitate the organization. During 2003, RNGR requested information from 560 tribes across the United States,
seeking specific information on tribes' needs for native plants, facilities, training, and so on. Results from the responding 77 tribes were incorporated into the Tribal Nursery Needs Assessment. Based on the results of that questionnaire, and input from tribal members attending the 2003 Intertribal Nursery Council meeting in Coeur d'Alene, Idaho, it was agreed that a nursery handbook was needed. That fall, planning began for writing the manual, loosely based on Agriculture Handbook 674, The Container Tree Nursery Manual, but with special attention to the uniqueness of Native American cultures.

A History of Wine in America, Volume 2-Thomas Pinney 2005-07-05 A History of Wine in America is the definitive account of winemaking in the United States, first as it was carried out under Prohibition, and then as it developed and spread to all fifty states after the repeal of Prohibition. Engagingly written, exhaustively researched, and rich in detail, this book describes how Prohibition devastated the wine industry, the conditions of renewal after Repeal, the various New Deal measures that affected wine, and the early markets and methods. Thomas Pinney goes on to examine the effects of World War II and how the troubled postwar years led to the great wine boom of the late 1960s, the spread of vinegrowing to almost every state, and its continued expansion to the present day. The history of wine in America is, in many ways, the history of America and of American enterprise in microcosm. Pinney's sweeping narrative comprises a lively cast of characters that includes politicians, bootleggers, entrepreneurs, growers, scientists, and visionaries. Pinney relates the development of winemaking in states such as New York and Ohio; its extension to Pennsylvania, Virginia, Texas, and other states; and its notable successes in California, Washington, and Oregon. He is the first to tell the complete and connected story of the rebirth of the wine industry in California, now one of the most successful winemaking regions in the world.

Rattlesnakes and Bald Eagles-Chris Townsend 2014-11-06 As probably the world's most experienced long distance walker who also writes, Chris Townsend has many stories to tell and many photographs to illustrate them with. Of all his adventures, those he enjoyed on America’s Pacific Crest Trail in the Eighties are among his favourites. The PCT runs 2,600 miles from Mexico to Canada through desert, forest and mountain wildernesses. In Rattlesnakes and Bald Eagles Chris recounts not only his own six month walk but also the longer story of the Trail, and shares his ideas on how it is developing and where it is all going with his many readers. Illustrated with Chris Townsend's photographs from his long hike, and earlier, iconic images, Rattlesnakes and Bald Eagles will be the definitive Pacific Crest Trail account.

Effects of Debris on Bridge Pier Scour-Peter Frederick Lagasse 2010-01-01 TRB's National Cooperative Highway Research Program (NCHRP) Report
653: Effects of Debris on Bridge Pier Scour explores guidelines to help estimate the quantity of accumulated, flow event debris, based on the density and type of woody vegetation and river bank condition upstream and analytical procedures to quantify the effects of resulting debris-induced scour on bridge piers. The debris photographic archive, the survey questionnaire and list of respondents, and the report on the field pilot study related to development of NCHRP 653 was published as NCHRP Web-Only Document 148: Debris Photographic Archive and Supplemental Materials for NCHRP Report 653.

The Oxford Handbook of School Psychology-Melissa A. Bray 2013-09-05 The Oxford Handbook of School Psychology focuses on significant issues, new developments, and scientific findings that influence current research and practice in the ever-growing field of school psychology.

Wiley Handbook of Science and Technology for Homeland Security, 4 Volume Set-John G. Voeller 2010-04-12 The Wiley Handbook of Science and Technology for Homeland Security is an essential and timely collection of resources designed to support the effective communication of homeland security research across all disciplines and institutional boundaries. Truly a unique work this 4 volume set focuses on the science behind safety, security, and recovery from both man-made and natural disasters has a broad scope and international focus. The Handbook: Educates researchers in the critical needs of the homeland security and intelligence communities and the potential contributions of their own disciplines Emphasizes the role of fundamental science in creating novel technological solutions Details the international dimensions of homeland security and counterterrorism research Provides guidance on technology diffusion from the laboratory to the field Supports cross-disciplinary dialogue in this field between operational, R&D and consumer communities

Ecological Forest Management-Jerry F. Franklin 2018-03-19 Fundamental changes have occurred in all aspects of forestry over the last 50 years, including the underlying science, societal expectations of forests and their management, and the evolution of a globalized economy. This textbook is an effort to comprehensively integrate this new knowledge of forest ecosystems and human concerns and needs into a management philosophy that is applicable to the vast majority of global forest lands. Ecological forest management (EFM) is focused on policies and practices that maintain the integrity of forest ecosystems while achieving environmental, economic, and cultural goals of human societies. EFM uses natural ecological models as its basis contrasting it with modern production forestry, which is based on agronomic models and constrained by required return-on-investment. Sections of the book consider: 1) Basic concepts related to forest ecosystems and silviculture based on natural models; 2) Social and political foundations of forestry, including law, economics, and social acceptability; 3) Important current topics including wildfire, biological diversity, and climate change; and 4) Forest planning in an uncertain world from small privately-owned lands to large public ownerships. The book concludes with an overview of how EFM can contribute to resolving major 21st century issues in forestry, including sustaining forest dependent societies.

Numerical Solution of Partial Differential Equations on Parallel Computers-Are Magnus Bruaset 2006-03-05 Since the dawn of computing, the quest for a better understanding of Nature has been a driving force for technological development. Groundbreaking achievements by great scientists have paved the way from the abacus to the supercomputing power of today. When trying to replicate Nature in the computer’s silicon test tube, there is need for precise and computable process descriptions. The scientific fields of Mathematics and Physics provide a powerful vehicle for such descriptions in terms of Partial Differential Equations (PDEs). Formulated as such equations, physical laws can become subject to computational and analytical studies. In the computational setting, the equations can be discretized for efficient solution on a computer, leading to valuable tools for simulation of natural and man-made processes. Numerical solutions of PDE-based mathematical models has been an important research topic over...
centuries, and will remain so for centuries to come. In the context of computer-based simulations, the quality of the computed results is directly connected to the model’s complexity and the number of data points used for the computations. Therefore, computational scientists tend to fill even the largest and most powerful computers they can get access to, either by increasing the size of the data sets, or by introducing new model terms that make the simulations more realistic, or a combination of both. Today, many important simulation problems cannot be solved by one single computer, but calls for parallel computing.
